

10 STEPS TO WINTERIZING AN RV CAMPER

You don't want your RV damaged by freezing temperatures, torrential rain or howling winds.

Take a little time to prepare your home on wheels for the harsh winter months. ❤️

1 UNPACK THE CAMPER

Take out all valuables including the contents of the safe
Take out all food items
Remove anything that could succumb to the cold air

2 DEEP CLEAN YOUR RV

Deep cleaning not only prevents bugs and rodents sniffing out rogue crumbs but makes the camper trip ready for next year too.

3 WINTERIZE COMPOST TOILETS

Simply empty the "pee pot" & give it a deep clean by rinsing it in a light vinegar and water mixture. Leaving the composting material unused for months allows decomposition to continue.

4 ANTI FREEZE WATER SYSTEM

In areas where winters are long and cold, antifreeze is the most popular way to winterize the water system.

5 WINTERIZE WATER SYSTEM

Winterizing a camper with a low pressure air compressor is a less expensive method & doesn't use so much antifreeze.

6 DISCONNECT THE ELECTRICS

Make sure all electronic appliances and gadgets are disconnected from their sockets.
Turn off the isolator switches to and from the campervan batteries.

7 ISOLATE PROPANE TANKS

Switch off all the propane tanks. If you use the portable bottles, disconnect them and remove them if possible. For fixed propane tanks, shut off the isolator valve.

8 CHECK VENTS AND EXHAUSTS

They make ideal entrance halls for unwanted winter squatters like bugs and rodents, so cover them well but remember to keep some ventilation open.

9 WASH THE CAMPER

Give your camper a well deserved external valet. Clean all mirrors, wheels and inside the wheel arches and treat her to a wax treatment. Don't forget the awning, the roof and solar panels too.

10 PARK & STORE

Your camper is winterized now and it's time to park her in a winter storage spot, all ready for next year.
